

PHARO Client Founder Assessment: The "Steel Transformation" Case

We are evaluating your ability to navigate the intersection of business strategy, multi-agent AI architecture, and enterprise client management. You have 48 hours to complete this assessment. We are not looking for perfect code or a 50-page thesis; we are looking for clarity of thought, technical pragmatism, and an obsession with operational ROI.

The Scenario: Aceros Ibéricos S.A.

Assume the role of a Client Founder at PHARO. You have just secured an 8-week Pilot project with Aceros Ibéricos S.A., an €800M industrial titan specializing in steel transformation.

The Operational Bottleneck: The Asian subsidiary of Aceros Ibéricos handles all raw material procurement. They purchase steel based on highly specific "Bill of Materials" (BOMs) generated by the engineering team at the headquarters in Spain. Currently, HQ sends constant revisions of these BOMs via email to the subsidiary in Asia.

The Asian procurement team (15 FTEs) must manually:

1. Monitor the shared inbox.
2. Identify if the incoming email contains a new BOM, a revision, or a duplicate.
3. Extract the technical specifications (steel grade, thickness, tolerances, quantities).
4. Reconcile these unstructured specs against the rigid Material Master Data in their ERP (SAP).
5. Create or update the Purchase Order (PO) in SAP.

The Pain Point: This manual process is slow (a 24-48 hour delay due to time zones) and highly error-prone.

The Pilot Objective: Deploy PHARO's multi-agent AI technology within 8 weeks to automate the ingestion, extraction, and reconciliation of these BOMs into the ERP, drastically reducing processing time and eliminating critical purchasing errors.

The Reality of the Data (Operational Friction)

As you design your solution, you must account for the daily chaos the team faces:

1. Lack of Standardization: The engineers in Spain do not use a single template. Sometimes the BOM is an exported PDF from a CAD system, sometimes it's a table pasted into the email body, and sometimes it's an attached Excel file with handwritten notes in the margins (e.g., *"Note: Order this batch with a +2mm tolerance due to port humidity"*).

2. The ERP Rigidity: SAP's Material Master is unforgiving. If the email says "Galvanized Steel Type B", but the exact SAP code is **AC-GALV-TB-001**, a human analyst understands the context. If we push the literal text from the email via API, SAP will reject the PO.
3. The Cost of Error: If we purchase 500 tons of steel with the wrong thickness because we misinterpreted a note in an email, the cost to Aceros Ibéricos is €350,000 in unusable material, plus severe production line delays.

The Deliverable

You must prepare a Pitch Deck (**Maximum 6-8 slides**) that you will present to the executive team of Aceros Ibéricos during the Pilot Kick-off meeting. Your audience will be the CPO (Executive Sponsor) and the Global IT Director (Technical Sponsor). Your presentation must cover the following areas:

1. The "As-Is" and the "To-Be" (Process Mapping & AI Design)

- Map the current manual process (As-Is).
- Map your proposed solution flow using PHARO (To-Be).
- *Crucial:* Clearly specify what parts of the process will be fully automated by AI agents, where you will place the "Human-in-the-Loop" for validation, and what edge cases you will explicitly leave *out* of scope for this initial 8-week pilot.

2. Data Architecture & Readiness

- Based on your "To-Be" flow, define the specific data objects we need to extract from the emails.
- How will your solution handle "Friction #2" (reconciling unstructured email text with rigid SAP codes)?
- What specific permissions, connections, or technical access do we need the IT Director to provide in Week 1?

3. Execution Plan (The 8-Week Playbook)

- Provide a high-level timeline. What technical and business milestones must be hit each week to achieve a successful Go-Live in Week 8?
- What is your proposed cadence for client communication and risk management during the pilot?

Next Steps: The Live Defense

Please submit your deck in PDF format 24 hours prior to our next interview. During our next session, you will have 15 minutes to present this deck to us (acting as the CFO and IT Director of Aceros Ibéricos). The remaining 30 minutes will be a live Q&A and role-play session where we will challenge your scope, technical architecture, and project management approach under pressure. Good luck!
